## **Positronic Industries Expands PCS Line**

Positronic's Power Connector System series is a popular choice in a wide range of power applications. The PCS offers a variety of sizes, contact variants, termination styles and accessories to meet your needs.

The PCS series now offers right angle press-fit compliant terminations. Customers who require power connectors to be mounted at a right angle to the PCB can eliminate the need for soldering. This is an important option, considering the increase in lead-free requirements. Connectors can be installed using flat rock technology.

With contact resistance as low as 0.0007 ohms and current ratings to 30 amps per contact, the PCS series power connector series is an excellent choice for systems requiring a power interface between backplanes and power supplies or between system components. The PCS has many features, which can be used to meet a variety of power distribution needs including crimp, solder, and press terminations and sequential mating contacts.
