## **Polaris' releases an enhanced version of the AMC Tester (V1.1.0) fully compliant with PICMG specification AMC.0 R2.0**

**Lexington, Massachusetts, October 24, 2008** - Polaris Networks, a leading provider of Networking Protocol Test Tools, launched its enhanced version of the AMC Tester, v1.1.0, today.

This automated test suite has around 50 additional test cases compared to the earlier version, AMC v1.0.0. The additional test cases increase the coverage of the tester considerably thereby facilitating comprehensive testing of the Hardware Platform Management software by Telecom Equipment Manufacturers and System Integrators.

Commenting on the release, Sujit Purkayastha, VP, Business Development, Polaris Networks said, "Polaris is committed to continually provide its customers with upgraded versions of its test tool products. With this increase in test scripts in the current version, we believe the AMC Tester now covers all the testable requirements".

The current version of the AMC features more than 100 test scripts for testing mandatory carrier requirements and AMC management implementations. The tester has an easy-to-use Windows interface and complete source codes for test scripts are available, which helps users customize tests according to their requirements. The built-in Miniscope Protocol Analyzer aids the debugging process during system development and integration, reducing the time and resources spent, significantly.

**About Polaris Networks**

Polaris Networks has been known for its pioneering efforts in terms of creating interoperability guidelines and developing test tools that help manufacturers and service providers meet compliance requirements. These test tools cover a number of technologies such as wireless, xTCA and HPI. Today, Polaris is involved in developing test tools for other emerging technologies such as Long term Evolution (LTE). Additionally Polaris provides software development services to companies seeking to augment their own R & D resources with competent professional help from outside and bring new products and enhancements to the market quickly.
